AIMS & SCOPE

The conference provides a forum for engineers and non-engineering researchers working in the field of Autonomous Machines and Intelligent Robotics Applications. From an application perspective, the main focus areas are transportation and robotics, including land, air and water vehicles, as well as industrial and service robots used in manufacturing, logistics, assistance, and care. From a technological viewpoint, autonomous machines rely on artificial intelligence, machine learning, and advanced control algorithms, supported by appropriate modelling, sensors, and actuators. The conference therefore covers broad areas of engineering research and extends beyond traditional engineering disciplines, addressing topics such as human-robot interaction, cognitive and social behaviour, and ethical and legal issues related to the operation of autonomous systems.
